

# Which would you choose?

A.

*Normal Vision*

B.

*Vision with **Diabetic Retinopathy***

**It's simple:**  
**DIABETES affects**  
**your vision.**

The longer you've had diabetes, the more likely you are to have diabetic retinopathy. **Almost everyone with type 1 diabetes will eventually have nonproliferative retinopathy.** And most people with type 2 diabetes will also get it.

**(Early detection through regular eye exams is the key to prevention and preserving your vision...so, we hope you answered A above.)**
